

Low cost cadastral updating approach: an alternative for the Brazilian cities

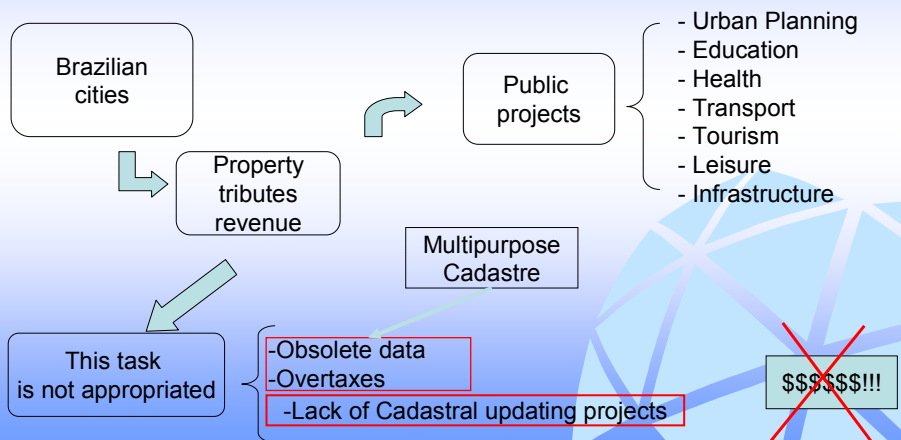

Guilherme Henrique Barros de Souza

Amilton Amorim

Julio Kiyoshi Hasegawa

Introduction

Introduction

- The current technological situation allows to invest in low cost cadastral projects
 - Low cost computers;
 - New equipments to data acquisition like orbital sensors to acquire images from Earth surface;
 - Many possibilities with the free software development;
 - Very important for small and medium cities.

Souza, G. H. B.

Objective

- The principal objective of this work is to show the viability of a approach that increases the efficiency of the change detection process applied to the property cadastre.

Souza, G. H. B.

Cadastral Updating and change detection

- Mapping is a basic tool in the process of making decision in public administration. However its existence is very scarce.
- In agreement with IDB (International Database) 72 % of the municipalities of the Latin America does not have maps of its jurisdiction in paper and not even in digital environment (COHEN 2000).

Souza, G. H. B.

Cadastral Updating and change detection

- In the urban reality, the problem becomes even bigger, because the change dynamism is high, due several factors such as
 - new allotments;
 - new buildings;
 - new infrastructure systems;
- All these changes must be contemplated in the cadastral data. In this work only geometric building data was considered

Souza, G. H. B.

Cadastral Updating and change detection

- Change Detection is a important tool for updating;
- The change detection between images of different times has been researched in several areas of knowledge.
- Olsen et al (2002) had affirmed that the task of change detection to mapping is not one of the easiest.

Souza, G. H. B.

Approaches procedures

- For the objective of time and cost reduction of this work to be reached, it was proposed the development of a technique that predicts the identification of new constructions or buildings that suffered significant changes in their built area in the last years.

Souza, G. H. B.

Approaches procedures

- Algorithms implemented change method the area

Approach Procedures

Changed Area Calculating Process

In the same reference system that the coordinates recorded in cadastral database

If this doesn't occur
- Ground Points
- Planar Transformation

In the end of this process, a text file is generated with the middle point of each change measured.

Anaglyph Model

Point measurements

Gauss' formula

To obtain change vertexes values

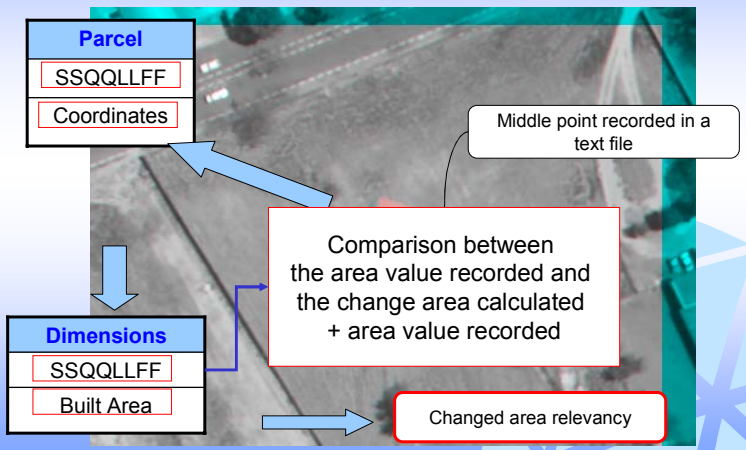

Changed area value

All values are recorded in a text file

Costs Reduction Evaluation

Areas	Approach	NTI	NIS L	Cost by property	Approach total cost
Area 01	Conventional	100	100	R\$ 18,00	R\$ 1800,00
	CD	100	19	R\$ 18,00	R\$ 342,00
Area 02	Conventional	50	50	R\$ 18,00	R\$ 900,00
	CD	50	02	R\$ 18,00	R\$ 36,00

US\$ 1112.00
€ 720.00

US\$ 211.00
€ 136.00

Only surveying costs!

City:
20000 properties
US\$ 225,000.00
€ 145,000.00

City: 19% of changes
3800 properties
US\$ 43,000.00
€ 27,300.00

Souza, G. H. B.

Conclusions

- By analyzing of the reduction of time and costs aquisition data, it is possible to affirm that the method here proposed is efficient and allows an economical resources optimization for the public administration;
- It possiblits favorable framework for administration to do cadastral updating periodic campaigns;

Souza, G. H. B.

Conclusions

- In further researchs, we intend to use QuickBird images to test the approach together with automatic techniques;
