5 James Bourchier Blvd., 1164 Sofia

# **Content:**

- **THE AIM OF OUR STUDY;**
- **DATA AND METHODOLOGY;**
- **FOG CASE STUDIES;**
- **RESULTS;**
- **MAIN CONCLUSIONS / SOME FUTURE PLANS.**

# Fog & Fog forecasting

- A general decision for good forecast is not possible
  - Fog is a local phenomenon;
  - Difficulties in parametrization of fog processes.
- Attracting new methods such as GNSS meteorology.

# **SYNERGY BETWEEN SYNOP OBSERVATIONS, GNSS TROPOSPHERIC PRODUCT, AND DETAILED SYNOPTIC ANALYSIS**

## **3 case studies in 2012:**

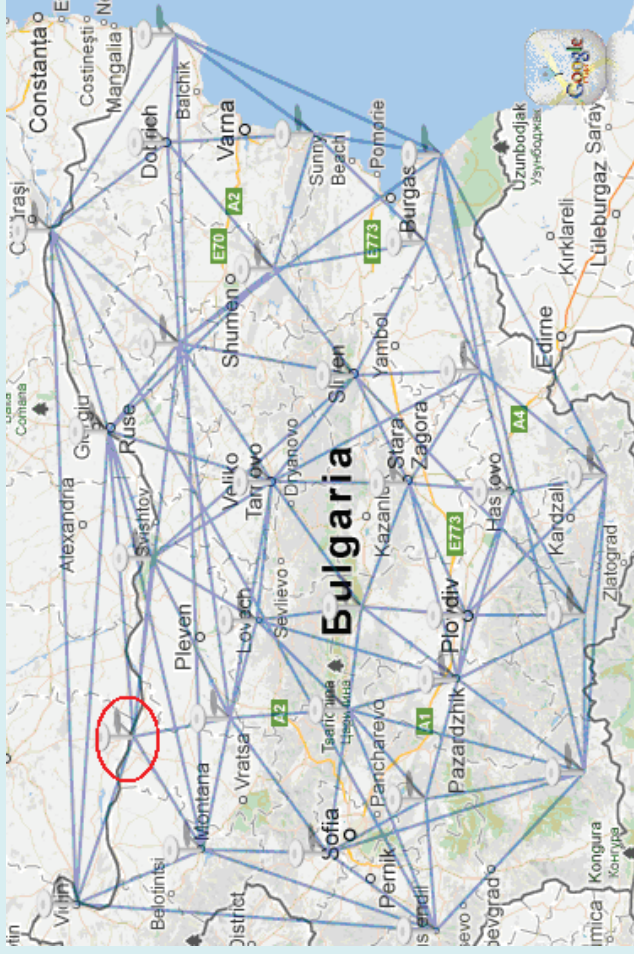

**21-23 Feb, 10-13 Nov, 25-30 Nov.**

- **SYNOP 00, 03, 06, 09, 12, 15, 18, 21 UTC for Oriahovo (North Bulgaria);**
- **GNSS data for IWV, 3-h temporal resolution;**
- **Synoptic charts.**

# Methodology

## GNSS tropospheric product & *Surface observations*

- 2 m air temperature,  $t$  [ $^{\circ}\text{C}$ ];
- 2 m relative humidity, RH [%];
- horizontal visibility (WMO, SYNOP), VIS [m];
- fog phase and type, wwWW – present and past weather (WMO, SYNOP);
- air pressure at surface,  $p$  [hPa];
- equivalent potential temperature [K];
- IWV [ $\text{kg}/\text{m}^2$ ].

# Fog case studies

- Case I: 21-23 Feb 2012 – radiation fog
- Case II: 10-13 Nov 2012 – radiation and advection fog
- Case III: 25-30 Nov 2012 – radiation, advection, radiation fog; in addition – dynamical component.

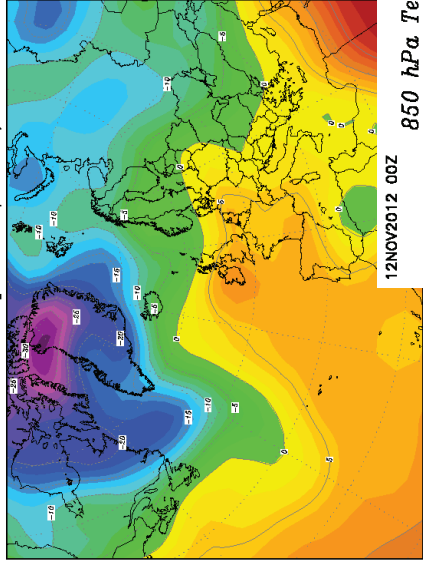

23FEB2012 00Z

500 hPa Geopotential (gpm) und Bodendruck (hPa)

23FEB2012 00Z

850 hPa Temperatur (Grad C)

# Case study I: fog duration 21-51 h

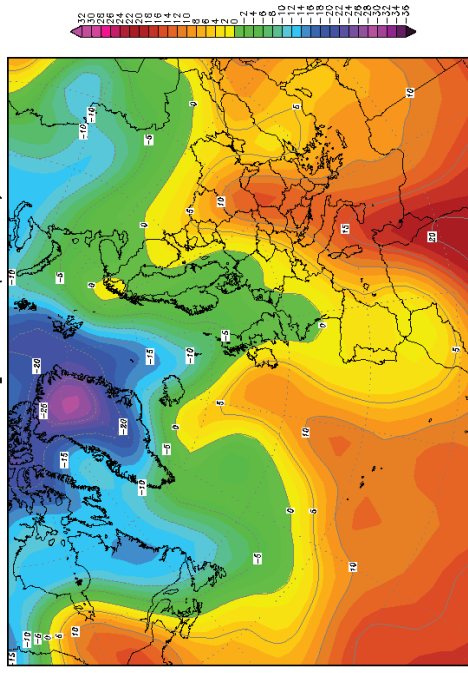

12NOV2012 00Z

500 hPa Geopotential (gpm) und Bodendruck (hPa)

12NOV2012 00Z

850 hPa Temperatur (Grad C)

# Case study II: fog duration 30-48 h

29NOV2012 00Z

500 hPa Geopotential (gpm) und Bodendruck (hPa)

2015

# What type of relations we studied in our work?

# Case II: radiation part IIa and advection part IIb

# Case III: radiation part IIIa, advection part IIIb, and radiation part IIIc

# Conclusions / Future plans:

- IWV shows a high sensitivity to air mass transformation;
- Advection of humid air mass at altitude can be tracked in IWV time series;
- Lowest values of IWV and EPT are detected during lowest visibility during radiation fog;
- IWV decrease leads to fog formation and/or fog densification;
- Increase of IWV links with fog dispersion;
- IWV encourage us to look for complex interaction between air masses and its local realisation over fog life cycle.
- Extending the study to other locations in Bulgaria and more cases;
- Investigations in better resolution;
- Access to the real-time GNSS tropospheric products will be an additional motivation for the development of an operational tool;
- More investigation needed to get more clear correlation between IWV and EPT.

# Thank you!
