# Geographical Location

## Motivation of this study:

- Surrounded by marine areas
- Low-lying coastal areas
- Flash flood due high tide
- Tide Gauge: data-sparse and no long term record from deep-ocean

Flash flood – George Town, Penang

Flash flood due to high tide

# Altimeter Principle

Radar pulse reflecting at the sea surface

$$SSH = H_{SALT} - R_{SALT}$$

$$SLA = SSH - MSS$$

**SLA:** The diff. between the time-independent *sea surface height (SSH)* and the *mean sea surface (MSS)*

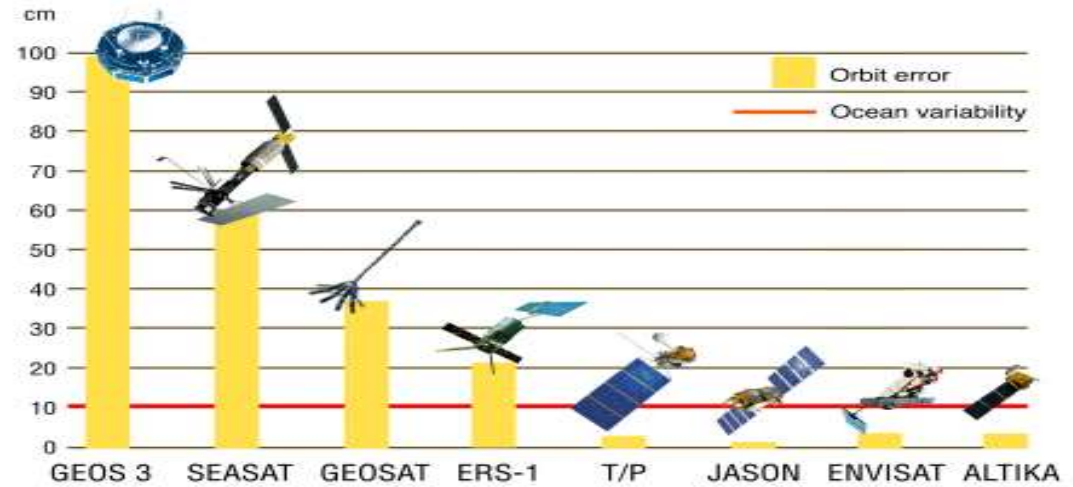

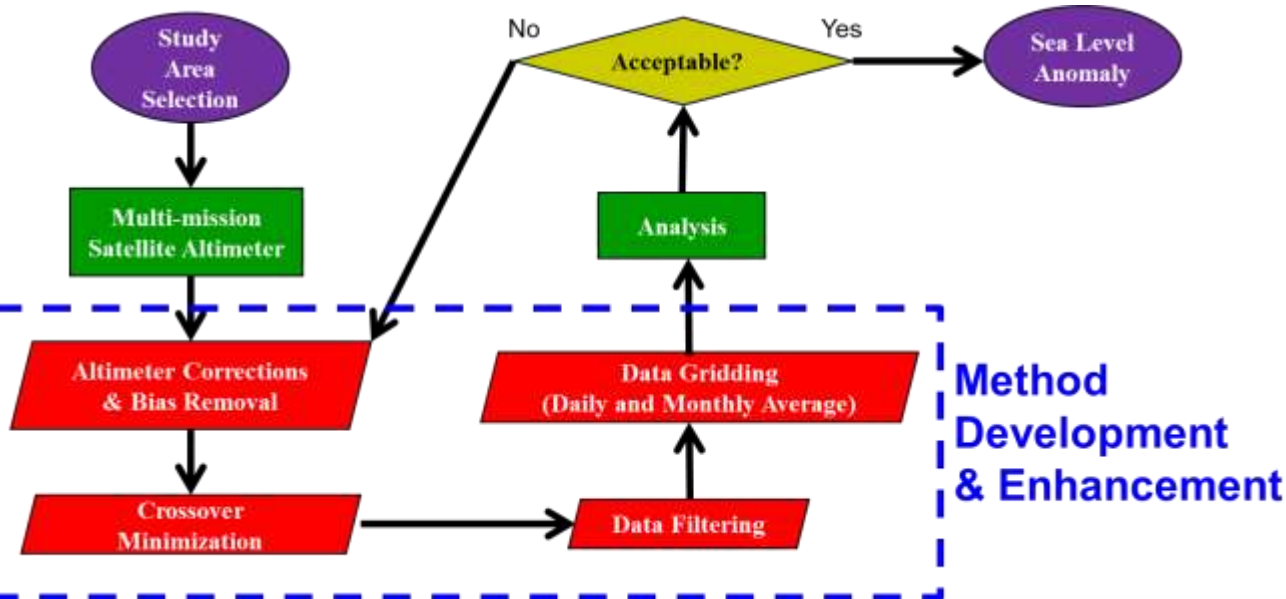

- $H_{SALT}$  = Satellite Orbit Height
- $R_{SALT}$  = Altimeter Range
- SSH = Sea Surface Height
- MSS = Mean Sea Surface
- SLA = Sea Level Anomaly
- N = Geoid Height

# DATA & METHODS

## Multi-mission Altimetry Data in RADS:

- Topex, Jason-1/2, ERS-1/2, ENVISAT, Cryosat, Saral/ Altika
- January 1993 – December 2015 (~ 23 years)

### DATA PROCESSING IN RADS

Satellite	Sponsor	Repeat Period	Track Spacing	Inclination	Perigee
TOPEX	NASA & CNES	9.9156 days	315 km	66°	1340 km
Jason-1	NASA & CNES	9.9156 days	315 km	66°	1336 km
Jason-2	NASA & CNES	9.9156 days	315 km	66°	1325 km
ERS-1	ESA	35 days	80 km	98.5°	780 km
ERS-2	ESA	35 days	80 km	98.5°	785 km
EnviSat	ESA	35 days	80 km	98.5°	796 km
Cryosat	ESA	30 days	250 km	92°	717 km
Saral	ISRO/ CNES	35 days	75 km	98.5°	800 km

TOPEX Class (TOPEX, Jason-1, Jason-2)  
ERS Class (ERS-1, ERS-2, EnviSat)

## Data Verification: Altimetry (red) vs Tidal Data (blue)

### Tide Gauge Station at Bintulu

### Tide Gauge Station at K. Kinabalu

## Quantification of Sea Level Rate

### Sea Level Time Series Analysis:

- Robust fit regression analysis technique in MATLAB
- A standard statistical technique that simultaneously deals with solution finding and outliers detection is applied
- In this robust fit approach, a linear trend is fitted to the annual sea level time series of each station in an Iteratively Re-weighted Least Squares (IRLS) procedure (Holland and Welsch, 1977).

$$w_i = \begin{cases} (1 - (u_i)^2)^2 & |u_i| < 1 \\ 0 & |u_i| \geq 1 \end{cases}$$

Where,

$$u_i = \frac{r_i}{K.S.\sqrt{1-h_i}}$$

## Points for Trend Analysis

- Altimeter point considered for trend analysis
- Altimeter point did not consider for trend analysis

The altimeter extracted points are focused for offshore or deep ocean areas because the residual of sea level anomaly increases closer to the coast due to the increased sea level variability in shallow water depth.

## Map of Sea Level Trend over Malaysian Seas

Sea Level Rise Rate from 1993 to 2015 using Satellite Altimeter

Region	Rate
Malacca Straits	1 to 4 mm/yr
South China Sea	3 to 5 mm/yr
Sulu Sea	3.5 to 5.5 mm/yr
Celebes Sea	3.5 to 6 mm/yr

## Time Series Analysis using Robust Fit Regression

Malacca Straits

South China Sea

## Time Series Analysis using Robust Fit Regression

Sulu Sea

Celebes Sea

# RESULTS & DISCUSSION

Group	Sea Level Rate (mm yr <sup>-1</sup> )
Malacca Straits	3.27 ± 0.12
South China Sea	3.88 ± 0.05
Sulu Sea	4.77 ± 0.14
Celebes Sea	4.95 ± 0.15
<b>Total Average</b>	<b>4.22 ± 0.12</b>

- The findings clearly show that the absolute sea level trend is rising and varying over the Malaysian seas with the rate of sea level varies and gradually increases from west to east of Malaysia.
- Highly confident and correlation level of the 23-years measurement data shows that the absolute sea level trend of the Malaysian seas has raised at the rate from **3.27 ± 0.12 mm yr<sup>-1</sup>** to **4.95 ± 0.15 mm yr<sup>-1</sup>** for the chosen sub-areas, with an overall mean of **4.22 ± 0.12 mm yr<sup>-1</sup>**.

# SUMMARY REMARKS

From the techniques and processing methods presented in this study, with a data span from 1993 to 2015 using multi-mission satellite altimetry data, we can conclude that:

- 1) The absolute sea level trend is rising and varying over the Malaysian seas.
- 2) With an overall mean, the sea level rate has been rising at a rate of  $4.22 \pm 0.12$  mm/yr, for the region of Malaysia.
- 3) The magnitude of sea level is increasing at about 5.3cm (overall mean) over Malaysian seas from 1993 to 2015.
